

Part 1. Explore Social Engineering Techniques

Step 1: Explore Baiting, Shoulder Surfing, and Pretexting.

What is baiting? Did you click on the USB drive? What happened to the victim's system?

ANSWER:Baiting is using a false promise to gain a victim's interest to lure them into a trap that steals their personal information or infects their systems with malware.yes. it gets infected

What is Shoulder Surfing? What device was used to perform the shoulder surfing? What information was gained?

ANSWER: Shoulder surfing is looking over someone's shoulder while they are using a computer and visually capturing logins or passwords or other sensitive information. Phone. Log-in and password information

What is Pretexting? What type of information did the cybercriminal request? Would you fall victim?

ANSWER: Pretexting is when an attacker establishes trust with their victim by impersonating persons who have right-to-know authority and asks questions that appear to be required to confirm the victim's identity, but through which they gather important personal data. The information requested is Name, tittle, office, and employee badge number. no.

Step 2: Explore Phishing, Spear Phishing, and Whaling

Phishing is designed to get victims to click on links to malicious websites, open attachments that contain malware, or reveal sensitive information. Use the interactive activity to explore different phishing techniques.

In this phishing example, what is the ploy the attacker uses to trick the victim to visit the trap website? What is the trap website used for?

ANSWER: Email that gives false information about her bank account that withdraw money. The trap website used to reveal sensitive information like user name and password.

What is the difference between phishing and spear phishing or whaling?

ANSWER: Phishing is random target, spear phishing is targeted version of phishing and whaling is focused on high profile targets

Step 3: Explore Scareware and Ransomware

Scareware is when victims are deceived into thinking that their system is infected with malware and receive false alarms prompting them to install software that is not needed or is itself malware. Ransomware is a type of malware that threatens to publish the victim's data or encrypts the victim's data preventing access or the ability to use the data.

Victims are prevented from accessing their system or personal files until they make a ransom payment to regain access.

What data does the attacker claim to have in this example? Would you fall for this deception?

ANSWER: Facebook Login, Credit Card Details and Email Account Login.

No, Now that you're aware of what scareware is, you know it's best not to call unknown numbers or share your account details.

What is the attacker requesting the victim do to get the data back?

ANSWER: To call them within 5mins to prevent their computer from being disabled

What is tailgating?

ANSWER: Tailgating is when an attacker who lacks the proper authorization follows a victim with authorized credentials through a door or other secure building access point into a restricted area.

Give three ways to prevent social engineering attacks?

ANSWER:

1. Think before you act - Never share personal information over the phone, email, or on unsecure websites. Do not click on links, download files, or open email attachments from unknown senders.

2. Stay aware of your surroundings – Be skeptical of links to web forms that request personal information, even if the email appears to come from a legitimate source. Never click on or enter sensitive information into a pop-up.

3. Keep your accounts and devices safe - Use anti-virus software, and spam filters, and update and patch your devices regularly.

Part 2. Create a Cybersecurity Awareness Poster

Use PowerPoint to create a poster that will make others aware of the different social engineering techniques used to gain unauthorized access to an organization or the organization's data.

Pick from: Baiting, Shoulder Surfing, Pretexting, Phishing, Scareware, Ransomware, Tailgating, or Dumpster Diving.

The poster should depict the techniques used and how users can avoid one of these social engineering attacks. Also include directions on where the poster should be placed within the organization.

STAY ALERT, STAY SAFE FROM CYBER THREATS

91%

OF ALL CYBER
ATTACKS BEGIN WITH A
PHISHING EMAIL

IT'S UP TO
YOU

CAN YOU SPOT A PHISHING EMAIL? DON'T BE SO SURE.

 **STOP**

NEVER AUTOMATICALLY CLICK
LINKS, OPEN ATTACHMENTS,
OR REPLY TO UNEXPECTED
EMAILS.

 **THINK**

WOULD THE SENDER REALLY
ASK FOR OR PROVIDE THIS
INFORMATION IN AN EMAIL?

 **VERIFY**

CONTACT THE SENDER
THROUGH A TRUSTED
CHANNEL TO CONFIRM
AUTHENTICITY.
